FORM HANDLING IN REACT

```
this.state = {
   email: ''
}
```

```
this.handleEmail = e => {
   this.setState({
      email: e.target.value
   })
}
```

```
<input type='text' value={this.state.email} onChange={this.handleEmail} />
```
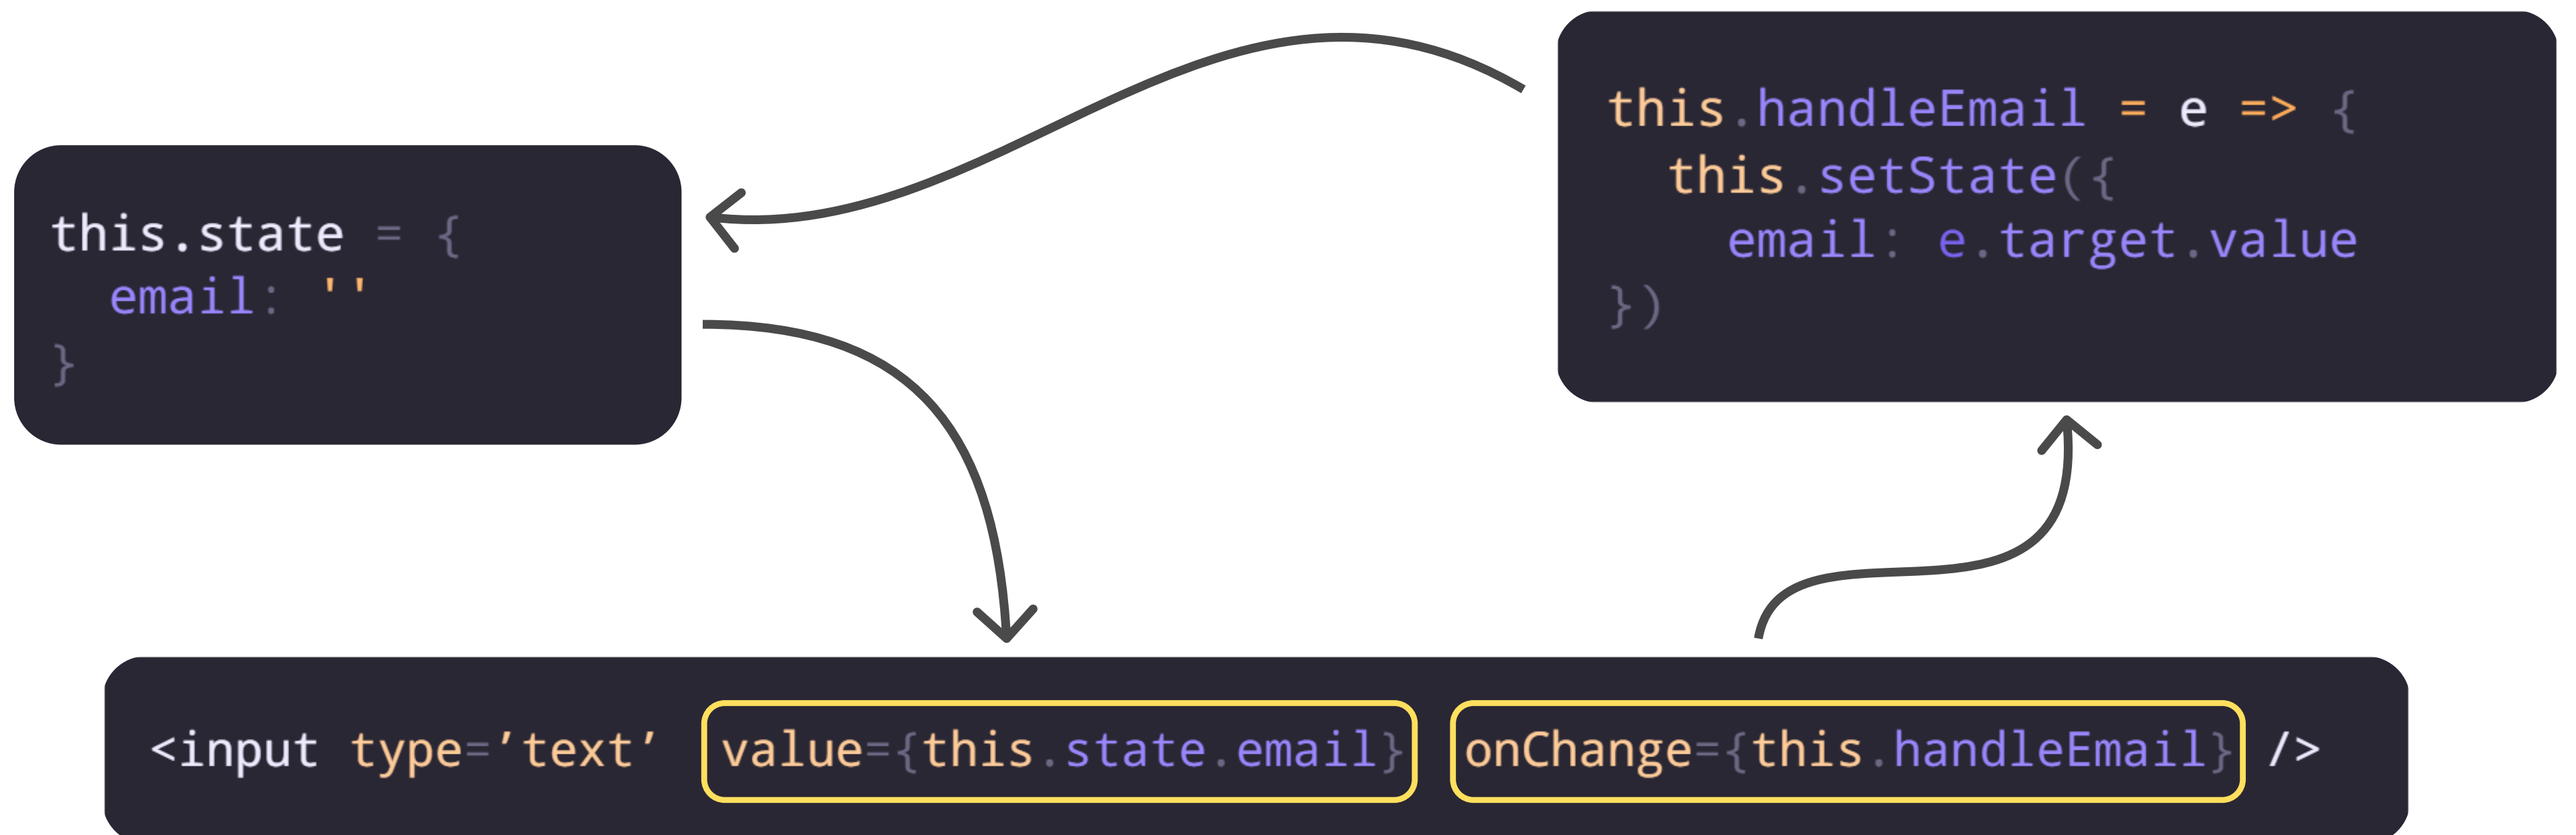

SUBMITTING THE FORM

1. To final submit the form, assign a handler on `onSubmit` event on your form tag.

```
1   <form onSubmit={this.submitHandler}>
```

2. Define the `submitHandler`.

```
1   submitHandler = (e) => {
2      alert("Thank you! Your response has been submitted.");
3      e.preventDefault();
4   };
```

add `e.preventDefault()` at the end of `submitHandler` to prevent it from reload after we submit our data
